September 2018

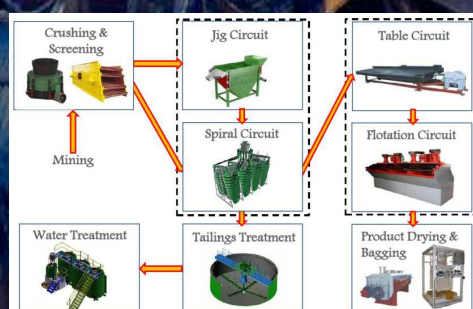

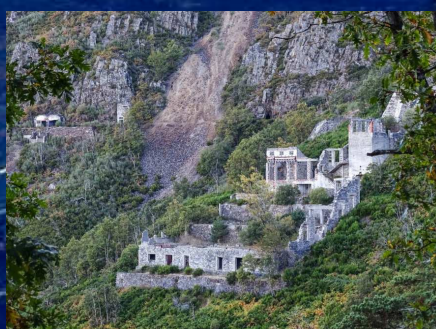

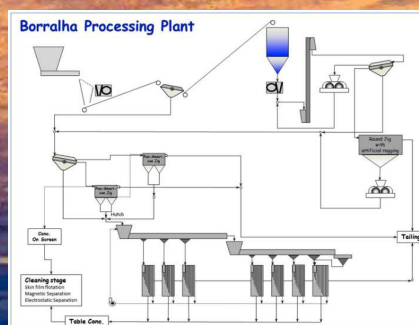

**"Development of environmental
and energy technology"**

Until now...

During the year 2018, within the framework of the POCTEP-ESMIMET Project, it has been carried out the inventory of signs, aimed at generating a unique, detailed and up-to-date database that gathers all the existing mineralized records in the area of scope of the Project: Castilla-León and the central and northern regions of Portugal

The traditional systems of treatment and processing in tungsten mining that currently exist have also been presented, describing in detail the processes that have been used to date in the processing of this technological mineral.

On September 27th, the POCTEP-ESMIMET project was presented by SIEMCALSA in the recently created mining Cluster that was held in León, together with companies in the extractive industry sector of mineral raw materials.

Coming soon...

In the coming months representatives of the POCTEP ESMIMET, will attend conferences and congresses organized by the organizations CONFEDM and PROMETIA.

On the other hand, the technical and dissemination tasks planned will continue, as well as project management meetings.
